

Submission guidelines:

I. Critical Deadlines

Deliverable	Deadline	Format
Project Report	May 22nd	PDF (Max 20 Pages)
App Submission	May 25th	GitHub Link or Source Code Zip

All submission materials (Report, Application and presentation slides) must be submitted to the Drive folder shared with each team's leader (having the format "G3 or G5 Team leader name").

II. Application Submission Guidelines

The goal of this submission is **reproducibility**. The evaluators must be able to run your code with minimal friction.

1. GitHub Requirements

If submitting via GitHub, your repository must include:

- **Clear Folder Structure.**
- **Dependencies:** Include a requirements.txt.
- **The README.md File:** This is your "Reproduction Manual." It must contain:
 - **Installation Steps:** Commands to set up the environment.
 - **Execution Guide:** How to launch the backend and frontend.

2. Alternative: Full Code Submission

If you choose not to use GitHub, you must submit a **single compressed file (.zip)** containing the entire codebase, following the same folder structure and including the README.md instructions.

III. Project Report Template (Max 20 Pages)

Use this structure for the May 22nd deadline.

1. Introduction

- **Overall Motivation:** Define the context and why this problem matters in today's environment.
- **Existing Solutions:** A brief overview of current non-AI tools or manual methods.
- **Main Pain Points:** Identify specific gaps (the pains, e.g., rigidity, lack of automation, complexity) that justify an AI-based approach.

2. The Proposed Approach

- **Problem-Solution Alignment:** Explain exactly how your AI strategy addresses the pain points identified in Section 1.
- **System Overview:** A high-level bird's-eye view of the architecture (how data flows from input to result).
- **Component-by-Component Explanation:**
 - **Logic/Algorithmic Core:** Detailed breakdown of the AI models or optimization techniques.
 - **Data & Infrastructure:** Brief overview of the backend, database, and integration tools.
 - **User Interface:** How the AI logic is presented to the user.

3. Tests & Experimentation

- **Tech Stack & Tools:** Provide a brief list of the specific tools used for implementation and testing (e.g., specific LLMs, libraries/toolkits, APIs, backend/frontend frameworks). Keep this part very concise.
- **Experimental Setup:** Define the scenarios used for testing (e.g., high-load, edge cases, fragmented inputs).
- **Comparative Analysis:** Performance of your system versus traditional methods or alternative algorithms.
- **Practical Validation:** Evidence-based results (metrics, success rates) highlighting how the original pain points are solved in practice.

- **Scenario-Based Results:** Visual or data-driven output showing how the system behaves under different conditions.

4. Conclusion

- **System Features Summary:** A final recap of the key capabilities and technical achievements.
- **Limitations & Root Causes:** Honest assessment of current constraints and why certain approaches (if any) did not meet expectations.
- **Future Work:** Realistic roadmap for improvements, scalability, and new feature integration.

5. Appendix & Team Contributions

- **Resource Allocation:** A clear list of each team member's technical responsibilities.
- **Supplemental Material:** UI screenshots, GitHub repository link, and additional charts.
